1. INTRODUCTION

The Food and Agriculture Organization of the United Nations (FAO) is promoting and co-ordinating programmes and activities on the monitoring and conservation of the productive capacity of living aquatic resources for fisheries and on the interaction of man's activities and the environment, including the problems of waste disposal, pollution, and related food contamination.

Within this mandate priority is given to assisting developing countries in research, monitoring and evaluation of the state of the aquatic environment and its management in relation to the protection of living resources, fishing and aquaculture, particularly in inland and coastal areas and enclosed seas, where pollution presents urgent problems. In this respect the FAO regional fisheries bodies are promoting and co-ordinating regional co-operative programmes of their member countries, and a number of studies have been published or are being prepared reviewing the state of aquatic pollution in the areas concerned, developing water quality criteria for the protection of the living resources, and compiling data and information on contaminants in aquatic organisms relevant to fisheries.

Simultaneously with these activities, and in order to predict and prevent future degradation of the aquatic environment and resources, and to provide the basis for decision-making, FAO has taken steps to facilitate the exchange of information and experience among countries, and to identify, evaluate and make available referral services to member states through its Fishery Data Centre in co-operation with the appropriate national institutions and in collaboration with regional scientific bodies and other institutions concerned.

Following Recommendation 91 of the UN Conference on the Human Environment (Stockholm, June 1972), information on the level of contaminants in various organisms, especially those of commercial importance, was included in the programme of work of the FAO Fishery Data Centre and in July 1973 as a first phase of a long-term programme the Data Centre distributed to marine and freshwater institutions around the world a questionnaire designed to collect information on programmes being undertaken to analyze and measure contaminants in aquatic organisms.

The results of this survey were published in a Directory of Institutions engaged in Pollution Investigations - Contaminants in Aquatic Organisms, in March 1974 and in a revised computerized edition in August 1974 (FAO Fisheries Circular No. 325, Rev. 1, Rome, August 1974).

While this publication provided a comprehensive summary of activity areas, it was felt that a data inventory should be produced in order to meet management requirements for specific data (e.g. mercury in North Atlantic swordfish).

Accordingly a FAO/UNEP Expert Consultation on Contaminant Monitoring - Data on Contaminants in Aquatic Organisms was convened in November 1974 in order to design a questionnaire suitable for meeting the above requirements (FAO Fisheries Report No. 161). This questionnaire was distributed in March 1975 to those institutes included in the first directory as well as several institutes which had entered the system since August 1974.

The first edition of the Inventory containing the information received as of 31 December 1975 was published in 1976 (FAO Fisheries Circular No. 338, Rome, February 1976).

In 1977 a second set of questionnaires was distributed to all the institutions which had not responded to the first questionnaire, as well as to those institutions that had indicated their interest in being included in the system.

The present version of the Inventory includes information received as of 31 December 1977.

2. USE OF THE INVENTORY

The Inventory consists of the following parts :

Index	1	Index by contaminant by host
"	2	Index by host by contaminant
"	3	Index by geographical area
"	4	Index by country of project
"	5	Details of project activities

The indexes 1 to 4 are displayed in alphabetical order and include the page numbers of the details of project activities (section 5) where the index identifiers occur. The project activities listed in section 4 are not in any order and can only be retrieved through the indexes. For example, should the user be looking for data on total mercury in Thunnus alalunga, he could find an inventory of such information on pages 009, 057, 101, 103, etc. Note that the indexes suppress categories where one criterion is missing, i.e. if no contaminant is listed for a particular species it will not appear in the index. The types of information available to the user in section 4 include :

(i) Name of project, institute where located, project leader, telephone/telex number, date for which information is valid

(ii) Project status, name of programme to which project belongs (if any), purpose of project, indication of whether or not project attempts to identify possible biological accumulators or substances not so far identified as contaminants

(iii) Details of data collection/storage by host (and by bodily part of host - not displayed) by contaminant by geographical area by water body type (code only is displayed). Following is the code file :

Type of Water Body Sampled

210 Aquacultural installation
211 Lake
212 River

Brackish water

220 Aquacultural installation
221 Lake
222 Swamp
223 Estuary
